The Pathophysiology and Pharmacotherapy of Myocardial Infarction deals with the advances in the pathophysiology and pharmacotherapy of acute myocardial infarction and related complications. This book covers two major consequences/cardiac muscle dysfunction and cardiac electrical dysfunction. This text begins by reviewing the controversy surrounding the pathogenetic mechanisms of atheroma formation and its potential reversibility, including the status of coronary risk factors and benefits of primary prevention. The pathophysiologic mechanisms of pump failure and the current approach to its management are then deliberated, followed by a discussion on the rational use of vasodilators in post-infarction heart failure and pharmacotherapy of cardiogenic shock. The rationale for the interest in the role of coronary vasospasm and thrombolytic therapy for acute myocardial infarction is also covered. This publication concludes by reviewing the approaches for the management of post-infarction ventricular tachyarrhythmias and concept of secondary prevention of sudden cardiac death. This compilation is valuable to medical students, primary care physicians, and cardiovascular specialists.
