Welcome! This course focuses on climate change in urban areas, covering how cities are affected by climate change, how they contribute to it, as well as how they plan for it. It includes one module divided into 6 sections, and takes around 2 hours to complete. Once the quiz is completed with above 70% of passing scores, you will receive a certificate of completion from UN-Habitat and UNITAR.

Climate change affects hazard vulnerability, and risk exposure in cities through a variety of direct and indirect relationships. Cities in many ways were first created as a means to more efficiently protect populations from hazards, whether they be physical (e.g., storms, droughts) or social (e.g., war, civil unrest) in origin.

The Urban Climate Change Research Network's Second Assessment Report on Climate Change in Cities (ARC3.2) is the second in a series of global, science-based reports to examine climate risk, adaptation, and mitigation efforts in cities. The book explicitly seeks to explore the implications of changing climatic conditions on critical urban physical and social infrastructure sectors and intersectoral concerns. The primary purpose of ARC3.2 is to inform the development and implementation of effective urban

significant global challenges facing the world today. It is also a critical issue for the world's cities. Now home to over half the world's population, urban areas are significant sources of greenhouse gas emissions and are vulnerable to the impacts of climate change. Responding to climate change is a profound challenge. A variety of actors are involved in urban climate governance, with municipal governments, international organisations, and funding bodies pointing to cities as key arenas for response. This book provides the first critical introduction to these challenges, giving an overview of the science and policy of climate change at the global level and the emergence of climate change as an urban policy issue. It considers the challenges of governing climate change in the city in

the context of the changing nature of urban politics, economics, society and infrastructures. It looks at how responses for mitigation and adaptation have emerged within the city, and the implications of climate change for social and environmental justice. Drawing on examples from cities in the north and south, and richly illustrated with detailed case-studies, this book will enable students to understand the potential and limits of addressing climate change at the urban level and to explore the consequences for our future cities. It will be essential reading for undergraduate students across the disciplines of geography, politics, sociology, urban studies, planning and science and technology studies.

the first time in history, the majority of the planet's population resided in cities. We are an urban planet. If ongoing changes in climate are to have an impact on the human species, most of these impacts will play out in cities. This fact was brought into full relief in the summer of 2003, when more than 70,000 residents of Europe perished in one of the most prolonged and intense heat waves in human history. The final death toll would exceed that associated with any Western European or American conflict since World War II, or any other natural disaster to have ever struck a region of the developed world, and the vast majority of these deaths occurred in cities. Studies in the aftermath of the heat wave would show that not only had global warming increased the likelihood of such an

extreme event, but that the intensity of the heat had been greatly enhanced by the physical design of the cities themselves, exposing residents of cities to a much greater risk of illness or death than others. This book is the first to explore the dramatic amplification of global warming underway in cities and the range of actions that can be taken to slow the pace of warming. A core thesis of the book is that the principal strategy advocated by the global science community to mitigate climate change - the reduction of greenhouse gases - will not prove sufficient to measurably slow the rapid pace of warming in cities"--

Climate change is one of the most challenging issues of our time. As key sites in the production and

management of emissions of greenhouse gases, cities will be crucial for the implementation of international agreements and national policies on climate change. This book provides a critical analysis of the role of cities in addressing climate change and the prospects for urban sustainability. Cities and Climate Change is the first in-depth analysis of the role of cities in addressing climate change. The book argues that key challenges concerning the resources and powers of local government, as well as conflicts between local goals for economic development and climate change mitigation, have restricted the level of local action on climate change. These findings have significant implications for the prospects of mitigating climate change and achieving urban sustainability. This

## Cities on a Finite Planet:

Transformative responses to climate change shows how cities can combine high quality living conditions, resilience to climate change, disaster risk reduction and contributions to mitigation/low carbon development. It also covers the current and potential contribution of cities to avoiding dangerous climate change and is the first book with an in-depth coverage of how cities and their governments, citizens and civil society organizations can combine these different agendas, based on careful city-level analyses. The foundation for the book is detailed

This book highlights where there is innovation and progress in cities and how this was achieved. Also where there is little progress and no action and where there is no capacity to act. It also assesses the extent to which cities can address the Sustainable Development Goals within commitments to also dramatically reduce greenhouse gas emissions. In this, it highlights how much progress on these different agendas depends on local governments and their capacities to work with their low-income

Climate change impacts are scale and context specific, and cities are likely to bear some of the greatest costs. In recent years cities have begun to craft their own climate change responses against the backdrop of the reluctance displayed by nation-states in committing to emissions reductions and managing the consequences of climate change. Climate Change at the City Scale presents a fresh contribution to climate change literature, which has largely neglected the role of cities in spite of their increasingly important role in the global economy. The book focuses on the impacts of climate change in the rapidly evolving city of Cape Town, and captures the experiences of the Cape Town Climate Change Think

Tank, a hybrid knowledge partnership which has produced research on a range of urban governance, impacts, mitigation and adaptation challenges by the City. Cape Town has long been acknowledged as an innovator in the area of urban environmental management, notwithstanding its limited resources to manage the demand for a more resilient and equitable future. By documenting the work and experiences of the City's efforts to define its own climate future, the book provides a provocative case study of the way in which the science-policy interface can be managed to inform urban transformation.
