This first volume of the series of the International Academy of Human Reproduction focuses on new aspects of reproductive medicine, from the professional responsibility model of ethics to the areas of high clinical involvement in human reproduction, such as endometriosis, polycystic ovary, family planning and post-coital contraception. The book discusses fertility and assisted reproductive techniques in the context of genetics and epigenetics as well as psychosomatic and longevity aspects. In addition, it presents new technologies and therapeutic strategies to improve IVF results and prevent ovarian hyperstimulation syndrome, as well the new challenges and the future of imaging in reproduction. Menopause and the effects of estrogens on athero-prevention, mood, and more generally the reproductive hormones impact on dementia and healthy aging are also covered. Further, it includes a section devoted to innovative aspects of gynecological surgery, discussing the treatments of vaginal aplasia, reproductive microsurgery and technological breakthroughs in pelvic organ prolapse surgery. Last, but not least, it examines the syndromic aspects of preterm birth. This volume is a useful and comprehensive tool for gynecologists, obstetricians, endocrinologists and all specialists who deal with women ' s reproductive health.

42 Authors cover all of the reproductive endocrine problems commonly encountered in the practice of obstetrics and gynecology. A question and answer study guide is also available.

This volume offers guidance on the evaluation and treatment of reproductive endocrinopathies and infertility. The book reviews the underlying physiology and pathophysiology of these disorders, describes contemporary pharmacological and surgical treatments, and presents definitive treatment recommendations based on current scientific and clinical data.

Assisted reproduction techniques have led to the birth of 8 million babies worldwide Assisted reproduction techniques (ART), in particular in-vitro fertilization and intra-cytoplasmic sperm injection, are the most advanced forms of infertility treatment. They involve numerous counseling, medical, surgical and laboratory-based steps. At each step various problems and complications could be encountered that challenge even the most experienced ART practitioners. Moreover, patients with complex medical disorders may require ART, presenting further challenges. Assisted Reproduction Techniques will stimulate resourceful thinking in the ART practitioner when faced with these challenges. It outlines various management options, the reasoning behind them, and the evidence on which they are based to enable the practitioner to choose the most suitable solution for the needs of each patient. Written by 171 internationally renowned experts, Assisted Reproduction Techniques follows the patient's journey throughout the whole ART process, with chapters on: Counseling and preparation Pituitary suppression and ovarian stimulation Oocyte retrieval Embryo transfer The luteal phase The ART laboratory The male patient The ART pregnancy General and organizational issues Each of the 116 concise chapters includes clinical cases, background, evidence-based practical management options, preventive measures, key-point

summaries of the important details and answers to questions patients ask. Assisted Reproduction Techniques first edition has established its place as a “ must read ” for ART trainees and practitioners alike, and in this second edition all chapters have been updated, with the addition of new ones addressing training issues, organizational and business skills, and social media use in ART.

One of modern healthcare's most controversial areas, reproductive medicine is an emerging discipline that fosters hugely divergent opinions on topics such as laboratory techniques, clinical management and ethical considerations. Highlighting over 50 contentious topics in reproductive medicine, this book presents expertly argued opinions for and against, often with diametrically opposing views about management. Debates such as these are being increasingly used as learning tools, helping participants develop their critical thinking skills and showing that context is vital when making decisions. Issues discussed include limits on IVF provision, ethical queries about sex selection, embryology, and ovarian stimulation. Authors are authorities in their field, combining years of experience with fresh and innovative ideas to structure their arguments. Readers will gain an insight into topical controversies, critically evaluating the different sides to enhance their own clinical practice.

Compiled by two experts in Reproductive Medicine, with contributions from internationally respected specialists, this innovative text lets the whole team in Reproductive Medicine get literally on the same page. Taking a cook-book approach to the operational procedures in the laboratory and in the clinic, it details what needs to be prepared in advance, what needs to be prepared earlier the same day, and what steps to take before, during, and after the procedure itself. This is an essential tool for ensuring all staff - whether experienced or starters - can be confident in their tasks and are in touch with what is expected of them and their colleagues.

Surgery, Assisted Reproductive Technologies and Infertility describes the intersection of assisted reproductive technologies (ART) and surgery in the diagnosis and treatment of a variety of clinical disorders in reproduction. Unlike many texts currently available, this book provides a road map for management well beyond the how-to for a given problem. It brings you a cogent explanation about the when and why of management. The author balances decision trees and management paradigms with equal weight to surgery and ART as complementary procedures to enhance reproductive potential. He carefully explains options incorporating diagnostic studies into the paradigm that include conventional radiography (eg, hysterosalpingography), two- and three-dimensional ultrasound imaging and MRI analysis. The text includes clear discussion of the rationale for selecting one technique over another and the supporting role for surgery as a prelude to ART or as an appropriate first line management. The text is centered on dividing evaluations in infertility into the tandem topics of structure and function. All chapters include data from studies directed at the assessment of structure using two- or three-dimensional ultrasound and the assessment of function using the technology of the emerging field of functional genomics. The introductory chapters cover embryology and anatomy of the female reproductive tract, evidence-based medicine in reproductive medicine and diagnostic studies that include imaging studies and the emerging field of microarray analysis and the insight gained from this technology. Each clinical chapter describes specific anatomic abnormalities and an approach emphasizing contemporary diagnostics and therapeutics. Every chapter begins with a historical perspective followed by discussions of state-of-the-art diagnostic studies, etiology, surgical management and guidelines for arriving at an outcomes driven decision regarding the intersection of surgery and ART. The discussion is supported by over 300 images and drawings illustrating each abnormality and surgical procedure. All recommendations are data and outcomes based. This approach minimizes anecdotal data, intuition or clinical hearsay. The text emphasizes an evidence-based approach and presents outcomes to support suggested plans of management. The most clinically and cost effective technology is matched to the clinical setting. Bottom line recommendations are written in a clear and concise bullet presentation at the conclusion of each chapter
