In retrospect the 19th century tmdoubtedly seems to be the century of evolutionism. The 'discovery of time' and therewith the experience of variability was made by many sciences: not only historians worked on the elaboration and interpretation of this discovery, but also physicists, geographers, biologists and economists, demographers, archaeologists, and even philosophers. The successful empirical fotmdation of evolutive processes by Darwin and his disciples suggested Herbert Spencer's vigorously pursued efforts in searching for an extensive' catalogue of prime and deduced evolutionary principles that would allow to integrate the most different disciplines of natural and social sciences as well as the efforts of philosophers of ethics and epistemologists. Soon it became evident, however, that the claim for integration anticipated by far the actual results of these different disciplines. Darwin I s theory suffered from the fact that in the beginning a hereditary factor which could have his theory could not be detected, while the gains of grotmd supported in the social sciences got lost in consequence of the completely ahistorical or biologicistic speculations of some representatives of the evolutionary research programm and common socialdarwinistic misinterpretations.

A complete account of evolutionary thought in the social, environmental and policy sciences, creating bridges with biology.

Tumor progression is driven by mutations that confer growth advantages to different subpopulations of cancer cells. As a tumor grows, these subpopulations expand, accumulate new mutations, and are subjected to selective pressures from the environment, including anticancer interventions. This process, termed clonal evolution, can lead to the emergence of therapy-resistant tumors and poses a major challenge for cancer eradication efforts. Written and edited by experts in the field, this collection from Cold Spring Harbor Perspectives in Medicine examines cancer progression as an evolutionary process and explores how this way of looking at cancer may lead to more effective strategies for managing and treating it. The contributors review efforts to characterize the subclonal architecture and dynamics of tumors, understand the roles of chromosomal instability, driver mutations, and mutation order, and determine how cancer cells respond to selective pressures imposed by anticancer agents, immune cells, and other components of the tumor microenvironment. They compare cancer evolution to organismal evolution and describe how ecological theories and mathematical models are being used to understand the complex dynamics between a tumor and its microenvironment during cancer progression. The authors also discuss improved methods to monitor tumor evolution (e.g., liquid biopsies) and the development of more effective strategies for managing and treating cancers (e.g., immunotherapies). This volume will therefore serve as a vital reference for all cancer biologists as well as anyone seeking to improve clinical outcomes for patients with cancer.

Biodiversity-the genetic variety of life-is an exuberant product of the evolutionary past, a vast human-supportive resource (aesthetic, intellectual, and material) of the present, and a rich legacy to cherish and preserve for the future. Two urgent challenges, and opportunities, for 21st-century science are to gain deeper insights into the evolutionary processes that foster biotic diversity, and to translate that understanding into workable solutions for the regional and global crises that biodiversity currently faces. A grasp of evolutionary principles and processes is important in other societal arenas as well, such as education, medicine, sociology, and other applied fields including agriculture, pharmacology, and biotechnology. The ramifications of evolutionary thought also extend into learned realms traditionally reserved for philosophy and religion. The central goal of the In the Light of Evolution (ILE) series is to promote the evolutionary sciences through state-of-the-art colloquia-in the series of Arthur M. Sackler colloquia sponsored by the National Academy of Sciences-and their published proceedings. Each installment explores evolutionary perspectives on a particular biological topic that is scientifically intriguing but also has special relevance to contemporary societal issues or challenges. This tenth and final edition of the In the Light of Evolution series focuses on recent developments in phylogeographic research and their relevance to past accomplishments and future research directions.

Human by Design invites you on a journey beyond Darwin's theory of evolution, beginning with the fact that we exist as we do, even more empowered, and more connected with ourselves and the world, than scientists have believed possible. In one of the great ironies of the modern world, the science that was expected to solve life's mysteries has done just the opposite. New discoveries have led to more unanswered questions, created deeper mysteries, and brought us to the brink of forbidden territory when it comes to explaining our origin and existence. These discoveries reveal the following facts: • Fact 1. Our origin -Modern humans appeared suddenly on earth approximately 200,000 years ago, with the advanced brain, nervous system, and capabilities that set them apart from all other known forms of life already developed, rather than having developed slowly and gradually over a long periods of time. • Fact 2. Missing physical evidence -The relationships shown on the conventional tree of human evolution are speculative connections only. While they are believed to exist, a 150-year search has failed to produce the physical evidence that confirms the relationships shown on the evolutionary family tree. • Fact 3. New DNA evidence -The comparison of DNA between ancient Neanderthals, previously thought to be our ancestors, and early humans tells us that we did not descend from the Neanderthals. • Fact 4. A rare DNA fusion -Advanced genome analysis reveals that the DNA that sets us apart from other primates, including in our advanced brain and nervous system, is the result of an ancient and precise fusion of genes occurring in a way that suggests something beyond evolution made our humanness possible. • Fact 5. Our extraordinary abilities -We are born with the capacity to self-heal, to self-regulate longevity, to activate an enhanced immune response, and to experience deep intuition, sympathy, empathy, and, ultimately, compassion -and to do each of these on demand. In this book, New York Times best-selling author and 2017 Templeton Award nominee Gregg Braden crosses the traditional boundaries of science and spirituality to answer the timeless question at the core of our existence -Who are we? -and to reveal science-based techniques that awaken our uniquely human experiences of deep intuition, precognition, advanced states of self-healing, and much more! Beyond any reasonable doubt, Human by Design reveals that we're not what we've been told, and much more than we've ever imagined.

New in paperback (originally published as Human by Design): At the cutting edge of science and spirituality, New York Times best-selling author Gregg Braden explains that evolution is not the whole story of humanity--and offers a new understanding of our origins that can help us tap the extraordinary abilities we already have. What would it mean to discover we're designed to live extraordinary lives of self-healing, longevity, and deep intuition? Is it possible that the advanced awareness achieved by monks, nuns, and mystics--considered rare in the past--is actually meant to be a normal part of our daily lives? In this revelatory book, now available for the first time in paperback, five-time New York Times best-selling author and 2018 Templeton Award nominee Gregg Braden explains that we no longer need to ask these questions as "What if?" Recent discoveries ranging from human evolution and genetics to the new science of neuro-cardiology (the bridge between the brain and the heart) have overturned 150 years of thinking when it comes to the way we think of ourselves, our origin, and our capabilities. In this reader-friendly journey of discovery, Braden begins with the fact that we exist as we do, even more empowered, and more connected with ourselves and the world than scientists have believed in the past. It's this undisputable fact that leads to even deeper mysteries. "How do we awaken the extraordinary abilities that come from such an awesome connection?" "What role does our ancient and mysterious heritage play in our lives today?" Join Gregg as he crosses the traditional boundaries of science and spirituality to answer precisely these questions. In doing so he reveals a) specific tools, techniques, and practices to awaken our deep intuition on-demand, for self healing and longevity; and 2) concrete solutions to the social issues that are destroying our families and dividing us as people, including the bullying of young people, hate crimes, the growing epidemic of suicide, religious extremism, and more. When new discoveries prove that the existing human story is no longer based in fact, it's time to change the story. This simple truth is at the heart of the book you're about to read.

Bringing together conceptual obstacles and core concepts of evolutionary theory, this book presents evolution as straightforward and intuitive.

Taking a close-up look at the complexities of evolution, the author of Virus X and The Forgotten Plague explores the role of interaction among species in promoting the diversity of life, examining key examples of symbiosis and demonstrating that huge leaps in evolution have arisen from the blending of life forms.
