This guide to dealing with the acute eye patient concentrates on diagnosis and early management. Illustrated in full colour throughout, it provides concise information for dealing quickly with ocular emergencies. Backed up with tables of differential diagnosis, advice on when to refer, and algorithms on management policy, it is a comprehensive handbook for anyone starting in ophthalmology

This handbook is designed to help shape the thought processes of the eye clinician or trainee and guide them toward the right decision-making pathway in emergency ophthalmology situations. Chapters are titled by the way cases present to eye casualty rather than condition, along with an algorithmic approach on what clinical and laboratory investigations to carry out. There is also guidance on how to perform simple procedures. It is aimed at trainees, general ophthalmologists and those with an interest from allied specialities (including specialist nurses) and professions such as optometrists and emergency medicine doctors. Key Features Stresses safe and practical navigation of common eye symptoms presented in an emergency setting. Provides guidance on differential diagnosis and includes useful decision-making flowcharts. Emphasizes "how to" approach the eye casualty patient. Shows what can be expected at each stage of the eye injury patient encounter. Presents information appropriate for the entire multi-disciplinary eye casualty team

This new handbook offers clinicians expert guidance on the most common ophthalmic problems that present to a doctor on call or to a primary care provider's office. Included is everything a non-specialist needs to know in order to screen, identify, treat, and if appropriate, refer conditions related to the eye.

The second edition of Eye Emergencies offers an excellent up-to-date resource for anyone whose work involves dealing with acute ophthalmic presentations. The authors have used the term 'practitioner' to include doctors, ophthalmic nurses, emergency care practitioners, nurse practitioners, nurses in accident and emergency departments and 'walk in' centres and first aid workers in remote locations such as oil rigs or working in the armed services. Aimed at readers with differing levels of confidence, skills and knowledge, Eye Emergencies will help all practitioners develop greater competence in ophthalmic emergency practice. The system of flag symbols in the margins, highlighting the diagnostic significance of symptoms described in a particular context, makes this book particularly useful for quick reference. Contents include: Anatomy and physiology of the eye Initial assessment Differential diagnosis of emergency eye conditions Urgent eye conditions Non-urgent eye conditions Drugs commonly used for acute eye conditions Ophthalmic pain Concluding notes Ophthalmic procedures Glossary of ophthalmic terms Index

This book aims to cover the important pediatric ophthalmic diagnoses that present in the emergency room. A collaborative work of experienced experts, it describes the history, examination, testing, epidemiology, pathogenesis, treatment, and prognosis for a variety of disorders. Richly illustrated, the book offers an invaluable tool for all specialists and trainees entrusted with the care of children presenting with ocular conditions. Across 17 comprehensive yet concise chapters, this book provides an overview on a number of typical pathologies, including trauma, infections, inflammations, and tumors. Organized into five sections, each chapter is written to relay broad insight into the common ophthalmic conditions that may bring a child in for an acute healthcare visit. Additionally, skillfully written text is further supplemented by many high-quality images, including clinical photographs, fundus images, radiographs, and intraoperative photos. Pediatric Ophthalmology in the Emergency Room meets the market need for a resource on this specific topic designed for trainee instruction. It is a valuable text for medical students, residents, and fellows, as well as anyone involved in the urgent or emergent care of children, including ER physicians, ophthalmologists, optometrists and other personnel.

Includes chapters on basic examination, red eye, trauma, watering eye, visual systems, tumors, eye surgery and complications and eye drops and drugs.

This book provides emergency physicians with an easy-to-use guide for diagnosing and treating ophthalmologic conditions in the emergency department. Ophthalmologic complaints are very common, but many emergency physicians are not as confident as they would like to be when evaluating and managing these conditions. This book answers that need by giving step-by-step instructions on how to diagnose and treat common eye conditions, including glaucoma, infections, neuro-ophthalmologic conditions, and trauma. For each disorder, the book discusses presentation/symptoms, physical examination techniques, lab and imaging findings, differential diagnoses, treatment guidelines, and referral suggestions. The text is filled with images that clearly present these common ophthalmologic complaints and conditions and guide the emergency physician to an accurate and swift diagnosis. Handbook of Emergency Ophthalmology is an essential resource for emergency physicians, residents, medical students, nurses, and other healthcare workers who evaluate and manage patients with ophthalmologic conditions.

This manual is introduced globally to the ophthalmic community, with the primary focus on the practicing eye care provider, and all those involved-in, or interested-in the management of ocular diseases. Ocular management issues are complex and inter-related to basic science, and to clinical presentations of a large spectrum of ocular diseases. Of equal importance is the recognition and diagnosis of the individual patient's ocular disease state. Proper diagnosis will then channel the clinician in the correct direction to engage in the optimal management of the ocular condition, and thus relieve the patient's signs and symptoms, and possibly improve the way the patient sees the world. All these clinical activities are often performed within a very narrow time-slot, with limited chair-time for the individual patient. It is of paramount importance to maximally utilize this limited time segment to deliver the best possible care to our patients. At the same time, it is important not to compromise eye care at the expense of speed. Hence, a clinician often needs the diagnostic and therapeutic reference materials that can be used in a short time to answer his clinical question(s). With this in mind, the text is written in an easy-to-read, quick reference format, while at the same time providing an extensive, and most comprehensive material, that the clinician will find extremely useful. Also, practical images are inserted throughout the text to complement the process of clinical patient care. This book helpful for practising ophthalmologists and students.

Ocular Emergency is a systematic, symptom based reference book for clinical practice guidance. This book aims to provide the most thorough knowledge and standard process to clinical practitioners, such as the nurses, medical students, residents, fellows and even ophthalmologists, to help them make the most appropriate decision on the management of patients who have suffered from urgent ocular conditions. The first three chapters provide the audiences general information of ocular emergency and the emergency room (ER), which will help them generate a clinical thinking. The following four chapters are symptom based discussion of common complaints of ocular emergency. These chapters contain almost all the symptoms the audiences will meet in the ER and covers hundreds of diseases the audiences may or may not think of which fits the symptom. They will help the readers to make the right diagnose and offer the best advice or treatment to the patients. The last two chapters provide the audiences the information of most urgent ocular traumas. For each disease, definition, etiology, clinical presentations and signs, treatment and typical clinical case with pictures or illustrative figures will be provided. In addition, each chapter will be provided with an algorithm(s) for differential diagnosis and treatment as a summary of the chapter. Hopefully this book may help the clinical practitioners to be fully prepared for any challenge of ocular emergency cases.
