The number of people suffering from this debilitating condition is predicted to grow exponentially over the next decade. This has serious implications for the health services. Investigating heart failure is not cheap even where facilities exist. The drugs used, though effective - often remarkably so - are also costly as are laboratory investigations. These again are not cheap. People with heart failure require frequent admissions to hospital and occupy many beds and much staff attention. All of these factors are set to increase over the next decades. This eclectic collection of papers tackles many of the issues that concern those who care for individuals with heart failure; organisation of services, exercise, palliative care amongst them, but also novel and rarely discussed issues. The book is suited to both pre and post-registered health care students. We do not supply inspection copies but we do supply Examination copies, whereby a course leader has 30 days to evaluate the book, then choose to adopt, purchase or return the book. Heart failure is a devastating syndrome that will affect one in every three adults in the United States. Heart failure management is costly and patients diagnosed with heart failure use a disproportionately high percentage of healthcare dollars. The management of heart failure patients is time consuming and complex. Nurse practitioners are well suited to provide quality care to this population of patients and through aggressive management and education keep hospital patients from multiple readmissions.

Heart failure is a condition that often results in chronic tiredness and shortness of breath. It also requires complex nursing and medical treatment, especially after a hospital admission, which is all too frequent for persons with heart failure. This book describes and discusses the latest research concerning the benefits of having specially trained nurses manage the care of patients with heart failure after they have been discharged from hospital to their own home. Leading nurses and doctors from around the world discuss their experiences with this type of innovative and effective care program. Building upon these experiences, the book also contains a practical guide to developing this type of care program into a fully functional service that provides quality care to those patients admitted to hospital with heart failure.
