Project Earth Science: Astronomy, Revised 2nd Edition,  
involves students in activities that focus on Earth’s position in  
our solar system. How do we measure astronomical  
distances? How can we look back in time as we gaze across  
vast distances in space? How would our planet be different  
without its particular atmosphere and distance to our star?  
What are the geometries among Earth, the Moon, and the  
Sun that yield lunar phases and seasons? Students explore

these concepts and others in 11 teacher-tested activities.

The complex internal structure of the Sun can now be studied in detail through helioseismology and neutrino astronomy. The VI Canary Islands Winter School of Astrophysics was dedicated to examining these powerful new techniques. Based on this meeting, eight specially-written chapters by world-experts are presented in this timely volume. We are shown how the internal composition and dynamical structure of the Sun can be deduced through helioseismology; and how the central temperature can be determined from the flux of solar neutrinos. This volume provides an excellent introduction for graduate students and an up-to-date overview for researchers working on the Sun, neutrino astronomy and helio- and asteroseismology.
