ultrasound velocity in

Introduction. For the application of ultrasonic techniques in medicine it is often desirable to know the ultrasound velocity in normal and pathological human tissue with an accuracy of about 1% (Schiefer and Kazner, 1967; Pia and Geletneky, 1968). This paper describes a

Echo-encephalography,  
introduced by LEKS  
ELL in 1955, has gained

increasing importance for the early detection of numerous intracranial lesions in the last decade. The main advantage of this diagnostic procedure lies in the fact that it permits a rapid orientation about the spatial relationships within the skull without stressing or endangering the patient. Although

this method alone only rarely allows a complete diagnosis, the echo-encephalographic findings always indicate which further diagnostic measures are most suitable for establishing the diagnosis with the greatest accuracy in every case. However, the correct interpretation of an echo-encephalogram is

possible only, if the findings which are assumed to be

pathological are

evaluated in the light of the clinical

symptomatology. Since JEPPSSON'S excellent monograph on the origin of the midline echo and its importance for the diagnosis of intracranial expansivities, published in 1961, a great deal of

work has gone into the development of echoencephalography all over the world. For this reason the possibilities of this procedure today go far beyond the mere demonstration of a supratentorial shift. Now we can frequently outline the width of the ventricles exactly and localize tumors or hematomas by means of

abnormal reflections.  
Since a detailed  
description of the  
technique, application  
and present-day  
diagnostic uses of echo-  
encephalography has  
not been available as  
yet, we undertook to fill  
this gap in the German  
literature in 1967 with a  
monograph  
summarizing the  
hitherto existing

The investigation of the brain by means of ultrasound has acquired increasing importance in the last years because it permits insight into the spatial relationships within the intact human skull in a short time without endangering the patient. The road from the first ultra sonic investigations on the

registration of echo  
pulsations and recently,  
to ultrasonotomography  
has been a long one  
already. However, this  
development is by no  
means at an end.

Following the  
suggestion of numerous  
colleagues concerned

with echo-

encephalography in this  
country and abroad, the

Neurosurgical Clinic of  
the University of

Erlangen-Nuremberg  
organized an

"International

Symposium on Echo-  
Encephalography" on

April 14th and 15th,  
1967. Here there was an

open exchange of  
experience on the results

obtained up to the present. The limitations of the method and sources of error as well as the directions of future development of the ultrasonic echo procedure were discussed.
