Abstract. Mast cells have existed long before the development of adaptive immunity, although they have been given different names. Thus, in the marine urochordate *Styela plicata*, they have been designated as test cells. However, based on their morphological characteristics (including prominent cytoplasmic granules) and mediator content (including heparin, histamine, and neutral proteases), test cells are thought to represent members of the lineage known in vertebrates as mast cells.

Progression of mast cell diseases: Part 1.
Among mast cell patients, we generally assume that a designation of SM means indolent systemic mastocytosis (ISM.) However, in research papers, this term can mean ISM, SSM, ASM or MCL. Advanced SM usually means ASM or MCL. These terms generate a lot of confusion in the patient population.

Mast cells are a major driver in the onset and progression of celiac disease. Celiac.com 05/18/2017 - Researchers understand pretty well that celiac disease is driven in part by an accumulation of immune cells in the duodenal mucosa as a consequence of both adaptive and innate immune responses to undigested gliadin peptides. Mast cells are innate immune cells that produce a majority of co-stimulatory signals and inflammatory mediators in the intestinal mucosa.

Mastocytosis is a condition where certain immune cells, called mast cells, build up under the skin and/or in the bones, intestines and other organs. This abnormal growth of mast cells causes a range of symptoms, including itchy bumps on the skin, gastrointestinal (GI) issues such as diarrhea, and bone pain.

Connective Tissue Tumors in Dogs. Mast cells are cells that reside in the connective tissues, especially those vessels and nerves that are closest to the external surfaces (e.g., skin, lungs, nose, mouth). Their primary functions include defense against parasitic infestations, tissue repair, and the formation of new blood vessels (angiogenesis). They are also associated with allergic reactions, since they contain several types of dark granules made up of

Systemic mastocytosis (SM) is a form of mastocytosis in which mast cells accumulate in internal tissues and organs such as the liver, spleen, bone marrow, and small intestines. It is typically diagnosed in adults. Signs and symptoms vary based on which parts of the body are affected. The disorder is usually caused by somatic changes (mutations) in the KIT gene.

chemokines without transducing any signals and thus presumably dampens inflammation. Consistent with this notion, the D6 deficient mice displayed enhanced inflammation in variety of disease models. However, our laboratory observed that absence of D6 caused an unexpected decrease in inflammation and reduced tumor burden in the ApcMin/+ mouse model of intestinal cancer. Intestinal tumors in D6-/-ApcMin/+ mice showed increased mast cell infiltration but their contribution to tumor progression is unknown. Therefore, unravelling the cellular and molecular mechanisms of mast cell mediated regulation

of intestinal tumor development is the central theme of this dissertation. Studies described in three specific aims utilize a combination of genetic, molecular and immunologic approaches to establish the importance of mast cells in the D6-/-ApcMin/+ model. Chapter III describes generation and characterization of the mast cell deficient D6-/-SA-/-ApcMin/+ mice. The results showed that the absence of mast cells led to decreased survival of these mice due to rapid progression of the intestinal adenomas. Analysis of total RNA from these cells by microarrays, real-time PCR showed that chemokine receptors, CCR2 and CCR5 are highly upregulated in D6-/- BMMCs compared to WT cells. The enhanced mRNA expression also correlated well with the enhanced protein and function of CCR2 and CCR5 in D6-/- BMMCs. Further studies will be required to identify the relevance of CCR2 and CCR5 to enhanced mast cell migration into D6-/-ApcMin/+ tumors. In Chapter V, immunofluorescence

studies on the extent of mast cell and CD8+ T-cell infiltration into intestinal adenomas of ApcMin/+, D6-/-ApcMin/+ and D6-/-SA-/-ApcMin/+ showed that cytotoxic T-cell infiltration is dependent on mast cell presence in the tumors. In contrast, analysis of D6-/-Rag2-/-ApcMin/+ tumors showed T-cell independent mast cell homing into these tumors. The pathogenesis of osteoarthritis (OA), the most common disease of the joints, remains unclear and there are currently no treatments that can prevent or slow disease progression. Although synovitis (i.e., inflammation of the membrane that lines synovial joints) and mildly elevated levels of white blood cells in synovial fluid are well-established features of osteoarthritis, the role of inflammation in osteoarthritis, as well as

the precise cellular and molecular mechanisms involved, are unknown. The studies presented in this dissertation support our overarching hypothesis that chronic, low-grade inflammation and activation of the innate immune system drive OA pathogenesis. In Chapter 2, we demonstrate a key pathogenic role for mast cells in OA. Genetic deficiency of mast cells protects against OA, and engraftment of mast cells reverses this protection. Furthermore, transcriptomic and proteomic analyses of OA synovial tissues and fluids demonstrate evidence of mast cell activation in human disease. In vitro studies

support a mechanistic role for tryptase as a mediator of mast cell-driven pathology in OA: tryptase promotes cartilage catabolism, induces chondrocyte apoptosis, and stimulates proliferation and proinflammatory responses of synovial fibroblasts. In Chapter 3, we demonstrate that the complement system, acting through its membrane attack complex-mediated arm, is pathogenic in OA. Genetic deficiency of complement components C5 and C6 or pharmacologic inhibition of complement with either CR2-fH, a fusion protein that inhibits activation of C3 and C5, or a monoclonal antibody to C5 attenuates joint

damage in a mouse model of OA, whereas deficiency of the MAC-inhibitor CD59a exacerbates disease. Moreover, complement expression is dysregulated in human OA, and MAC, when present on the cell surface at sublytic concentrations, induces chondrocyte expression of proinflammatory mediators and degradative enzymes relevant to OA. Finally, in Chapter 4, we demonstrate that Carboxypeptidase B (CPB) protects against OA, and it does so in part by inhibiting complement activation. Genetic deficiency of CPB exacerbates OA in mice. Moreover, we show that levels of CPB strongly correlate with

levels of MAC in OA synovial fluid, and CPB inhibits MAC formation and activity in vitro. Taken together, our findings emphasize the significance of innate immune responses in OA pathogenesis and support a thorough reexamination of the prevailing dogma that osteoarthritis is a non-inflammatory, 'wear and tear' arthritis. Furthermore, our increased understanding of the inflammatory underpinnings of OA suggests multiple avenues for the development of new, disease-modifying therapies.

responses to parasites. Their functional role, however, has been discovered to be increasingly complex and multifarious. Mast cells have been implicated in various cell-mediated immune reactions, being found in tissues from multiple disease sites, and as a component of the host reaction to bacteria, parasite, and even virus infections. They have also been shown to participate to angiogenic and tissue repair processes after injury. The importance of a possible functional link between chronic inflammation and cancer has long been recognized. As most tumours contain inflammatory cell

infiltrates, which often include plentiful mast cells, the question as to the possible contribution of mast cells to tumour development has progressively been emerged. In this book, the general biology of these cells, their development, anatomical distribution and phenotype as well as their secretory products will first be discussed. The biology of tumour cells, their structural and molecular characteristics, the specificity of the tumour microenvironment and the development of a vascular network in the tumour context will be analyzed. The involvement of mast cells in tumour biology
