para el Tratamiento de Aguas Residuales Domésticas El tratamiento y disposición de efluentes domésticos e industriales representan un gran reto en América Latina y el Caribe (ALC). A pesar de que la cobertura de saneamiento alcanza un 82% en la región, 110 millones de habitantes carecen de un sistema mejorado de saneamiento.

In many countries, especially developing countries, many people are lacking access to water and sanitation services and this inadequate service is the main cause of

diseases in these countries. Application of appropriate wastewater treatment technologies, which are effective, low cost (in investment, operation, and maintenance), simple to operate, proven technologies, is a key component in any strategy aimed at increasing the coverage of wastewater treatment.

Over the past twenty years, the knowledge and understanding of wastewater treatment has advanced extensively and moved away from empirically based approaches to a fundamentally-based first principles approach embracing chemistry, microbiology, and physical and bioprocess engineering, often involving experimental laboratory work and techniques. Many of these experimental methods and techniques have matured to the degree that they have been accepted as reliable tools in wastewater treatment research and practice. For sector professionals, especially a new generation of young scientists and engineers entering the wastewater treatment profession, the quantity, complexity and diversity of these new developments can be overwhelming, particularly in developing countries where access to advanced level laboratory courses in wastewater treatment is not readily available. In addition, information on innovative experimental methods is scattered across scientific literature and only partially available in the form of textbooks

or guidelines. This book seeks to address these deficiencies. It assembles and integrates the innovative experimental methods developed by research groups and practitioners around the world. Experimental Methods in Wastewater Treatment forms part of the internet-based curriculum in wastewater treatment at UNESCO-IHE and, as such, may also be used together with video records of experimental methods performed and narrated by the authors including guidelines on what to do and what not to do. The book is written for undergraduate and postgraduate students, researchers, laboratory staff, plant operators, consultants, and other sector professionals.

The protection of water resources from deterioration in quality by pollution discharges is probably the biggest challenge in sustainable water resources management in the recent decades. In practice, most countries have adopted pollution control strategies and measures which are based on 'end-of-pipe' solutions: wastewater treatment plants and adjustments to the regulations, including taxes for wastewater discharges (Conventional Strategy). Although this approach involves very high costs, on many occasions, this strategy has been a complete failure. The research described in this book contribute to the development of sustainable solutions for the previously outlined problem. It was based on the validation of

the Three-Step Strategic Approach concept (3-SSA), which includes: 1) prevention or minimisation of waste production; 2) treatment aimed at recovery and reuse of waste components, and 3) disposal of remaining waste with stimulation of natural self-purification of the receiving water body. The study showed overall positive effects of the 3-SSA, in comparison of Conventional Strategy, on wastewater management in the Upper Basin (389 km) of the Cauca river, the second most important river in Colombia. The Cost Benefit Analysis clearly favoured the 3-SSA, generating a major impact on the river water quality at lower cost compared to the Conventional Strategy.

Los residuos industriales liquidos de curtiembre presentan alta contaminacion organica y toxica provenientes del proceso. Ello constituye un problema ambiental y para la sobrevivencia de empresas que no cumplen exigencias de descarga de sus residuos. El objetivo de este estudio fue establecer parametros de operacion de una planta de tratamiento biologico por lodos activados a escala piloto, para el tratamiento de RIL generado en una industria de curtiembre que descarga a alcantarillado publico. De una industria de curtiembre se uso el RIL global, sometido a separacion de solidos en fosas de decantacion. El procedimiento consistio en realizar ensayos de biodegradacion batch para

seleccionar un inocular adecuado, considerando como criterio de seleccion la mayor velocidad inicial de consumo de sustrato. El seleccionado fue un lodo proveniente del tratamiento de RIL de un matadero. Luego, a traves de una operacion continua de un sistema a escala laboratorio, se obtuvo los parametros de diseno del tratamiento piloto que logro remover sobre un 80% de DQO. Se concluyo que el tratamiento de lodos activados al RIL de curtiembre constituye una alternativa real de tratamiento."

Artificial or constructed wetlands are an emerging technology particularly for tropical areas with water scarcity. For big cities, the sustainable management of water resources taking into account proper use is always challenging. The book presents case studies illustrating the above. As plants and microorganisms are a fundamental part of the correct functioning of these systems, their contribution to the degradation of the organic matter and to the removal and transformation of the pollutant compounds present in the wastewaters is also a highlight of this book.

This project originated with a Task Force of the Water Environment Federation's (WEF's) Spanish- and Portuguese-Speaking Advisory Group, to develop the Wastewater Engineering Glossary. The primary source of wastewater engineering terms is the glossary in

Operation of Municipal Wastewater Treatment Plants (MOP 11 - 4th Edition). The glossary was developed as a reference tool for engineering professionals in Spanish-speaking countries working with technical materials written in English. Conversely, the glossary is of value to the same spectrum of engineering professionals in English-speaking countries working with technical materials written in Spanish.

This book addresses the technical, health, regulatory, and social aspects of ground water withdrawals, water use, and water quality in the metropolitan area of Mexico City, and makes recommendations to improve the balance of water supply, water demand, and water conservation. The study came about through a nongovernmental partnership between the U.S. National Academy of Sciences' National Research Council and the Mexican Academies of Science and Engineering. The book will contain a Spanish-language translation of the complete English text.
